## **DETAILED ACTION**

## Election/Restrictions

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- Claims 1-4, drawn to a method of aligning an optical fiber with an optical device, classified in class 385, subclass 98.
- II. Claims 5-9, drawn to a method of connecting a first optical device with a first housing to a second optical device with a second housing, classified in class 65, subclass 406.

The inventions are distinct, each from the other because of the following reasons:

Inventions I and II are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case the different inventions achieve different objectives, namely invention I achieves alignment of optical devices via rotational means and invention II achieves a connection between the optical devices via a soldering technique.

Because these inventions are distinct for the reasons given above and the search required for Group I is not required for Group II, restriction for examination purposes as indicated is proper.

Application/Control Number: 10/045,207

Art Unit: 1731

During a telephone conversation with Alfred Muratori on October 1, 2003, a provisional election was made without traverse to prosecute the invention of group I, claims 1-4.

Affirmation of this election must be made by applicant in replying to this Office action. Claims 5-9 are withdrawn from further consideration by the examiner, 37 CFR 1.142(b), as being drawn to a non-elected invention.

## Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 1. Claims 1-4 are rejected under 35 U.S.C. 102(b) as being anticipated by Kiryuscheva et al (US 5,859,947). Kiryuscheva discloses a positioning device for aligning optical devices. The device provides for alignment through angular rotations about two or more axes of rotation (column 2, lines 1-9). The device can be operated in a manner whereby the axes of rotation are mutually perpendicular. For example, in a two axes configuration, the first axis of rotation is substantially perpendicular to the second axis of rotation and the first axis of rotation intersects the second axis of rotation at the alignment point (column 2, lines 60-63). Also, the device has at least one axis of symmetry which substantially coincides with at least one of the axes of rotation (column 2, lines 64-67). The device provides for more than two axes of rotational alignment, therefore reads on the claimed first, second, and third axis of rotation.

Art Unit: 1731

2. Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by Itoh et al (US 4,986,843). Itoh discloses an apparatus for aligning and fusion splicing optical fibers. The device aligns the fibers by means of three-dimensional translation of the fibers along the x, y, and z axes, and additionally by rotation of fibers about their longitudinal axis. See particularly Figure 3 for an illustration of the axes of alignment.

- 3. Claims 1-2 are rejected under 35 U.S.C. 102(b) as being anticipated by Pierson (US 5,812,258). Pierson discloses an optical coupler for rotational alignment of two optical components. The coupler comprises eccentric sleeves which not only rotates at least one of the optical components about its longitudinal axis, but also provides for changing the angle of the axis of one of the optical components relative to the other. The result is motion in five axes, three being translational and two being rotational (see column 4, lines 5-36). The angle is formed at the junction of the two optical components, therefore the two axes of rotation intersect at the joining ends of the components.
- 4. Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by Borner et al (US 3,800,388). Borner discloses an apparatus for aligning two optical components along a common axis, whereby each component is rotated about its optical (longitudinal) axis with respect to each other until the components are aligned.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. NOTE: Each of these references teach rotational orientation of an optical component

about its longitudinal axis in regards to optical alignment or fusion with another optical

component.
